XiangShan: An Open-Source High-Performance RISC-V Processor and Infrastructure for Architecture Research

The XiangShan Team

Institute of Computing Technology (ICT)

Chinese Academy of Sciences (CAS)

HPCA'24@Edinburgh, Scotland

March 2, 2024

What we will cover in this tutorial

- **Highlights XiangShan on Chips and FPGAs**

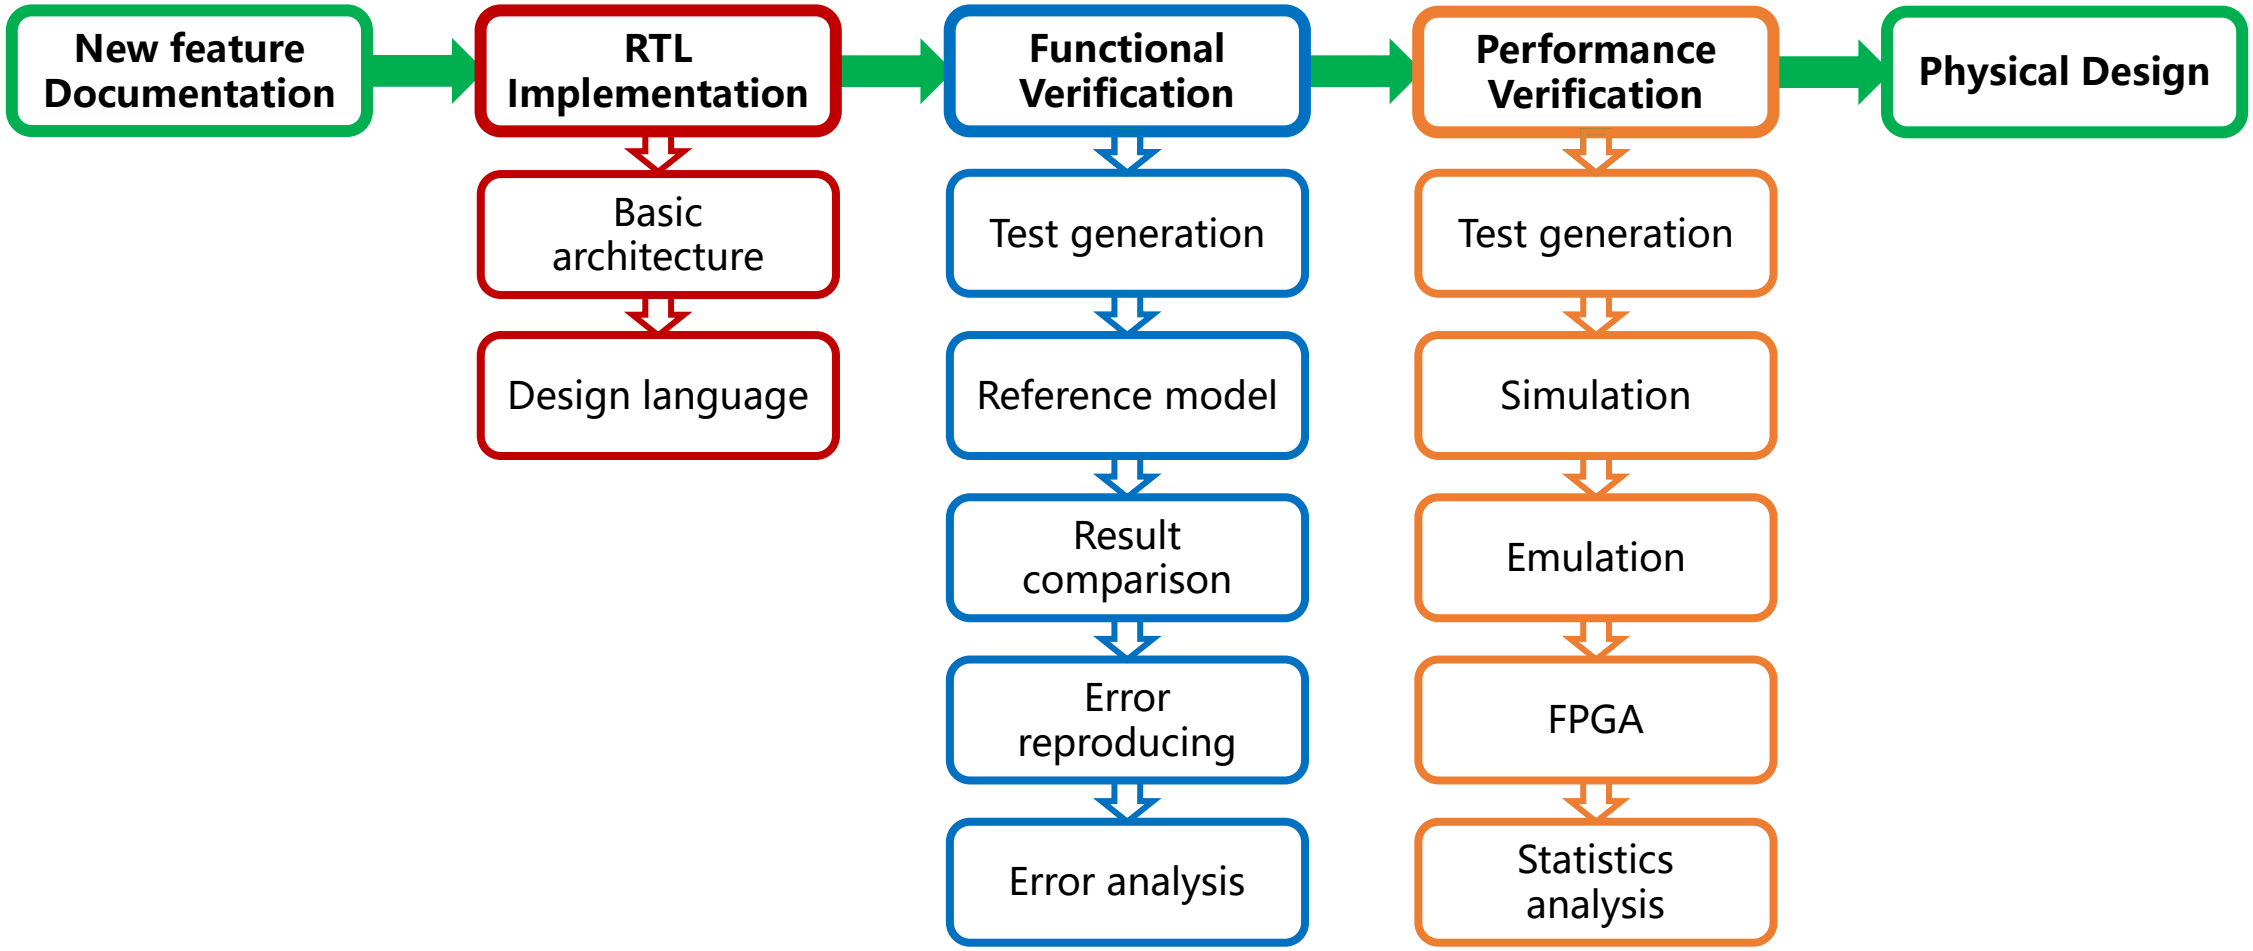
- **CPU Microarchitecture (60 minutes)**
  - *Design and implementation – How to implement novel ideas on XiangShan*
  - Frontend: branch prediction and instruction fetch
  - Backend: out-of-order scheduler, execution units
  - Load/Store Unit: LSQ, pipelines, TLBs, data caches
  - L2/L3 caches and prefetchers

- **Development workflows (60 minutes)**
  - *Introduction of their usages – How to develop on XiangShan with MinJie*
  - Simulation and Debugging
  - Research Demo

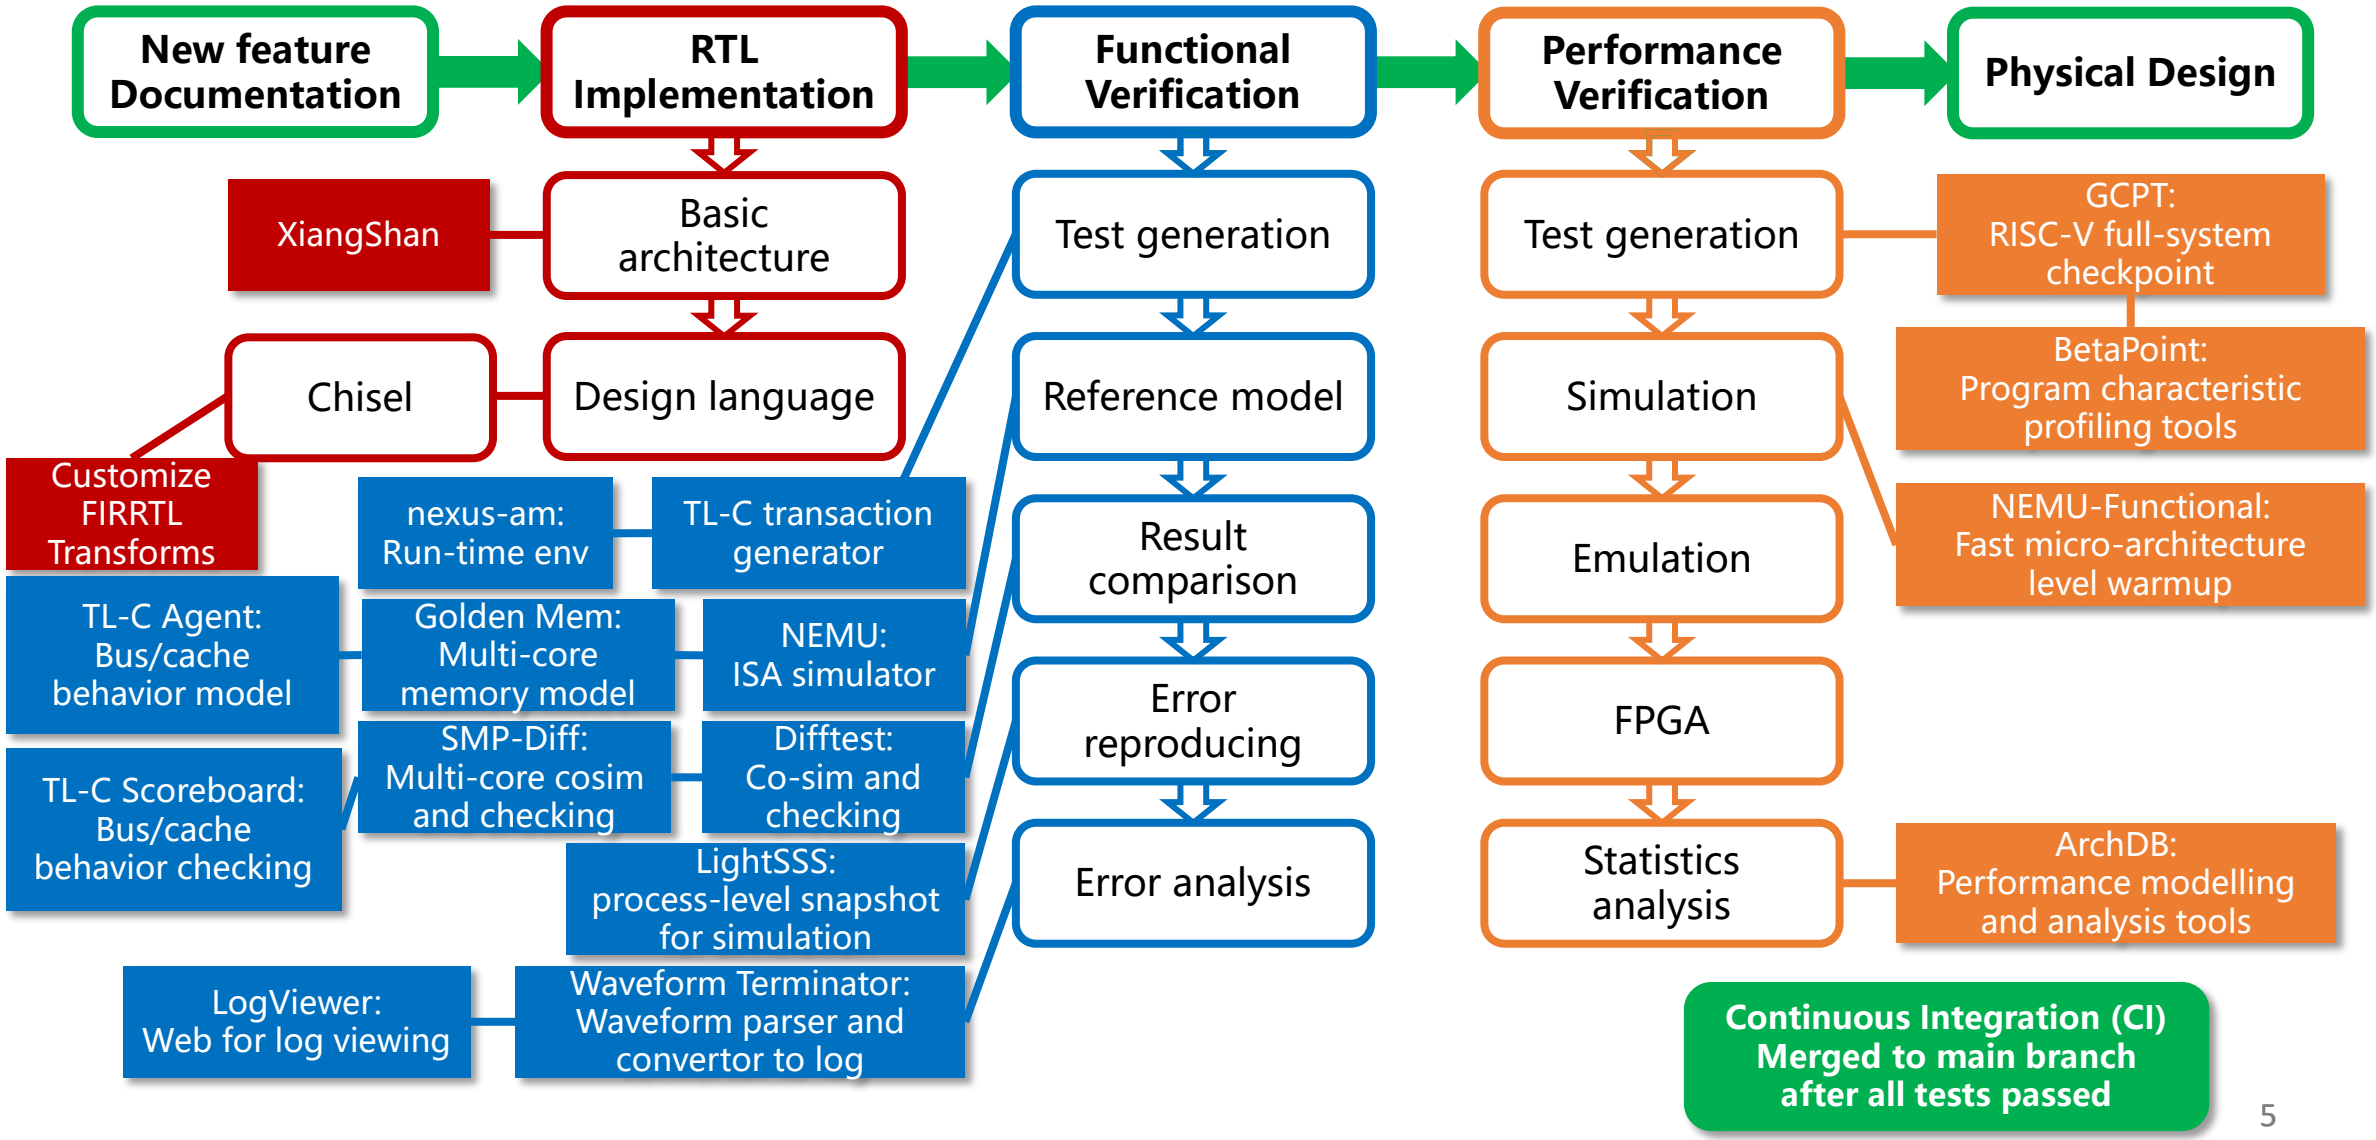
Tutorial@HPCA'24 Schedule

Time (AM)	Topic
8:30 - 9:00	Introduction of the XiangShan Project
9:05 - 10:00	Microarchitecture Design and Implementation
10:05 - 10:50	***Hands-on Development***
	Coffee Break
11:20 - 12:00	Hands-on Development & Discussions (Cont.)

Roadmap: MinJie Development Flows and Tools



Roadmap: MinJie Development Flows and Tools



In this tutorial, we will

- Provide access to cloud servers with you
- Prepare the XiangShan development environment for you
- Go through the development workflows including:

Simulation	Func. Verification	Perf. Verification	Research Demo
• Environment • RTL Generation • RTL Simulation ……	• Nexus-AM • NEMU • Difftest ……	• Perf. counter • Constin • Checkpoint ……	• Oracle BP • Top-Down ……

- ***Required: machines with networking and SSH***

Demo Instructions

- **Interactive shell commands** are highlighted in **brown box** with prefix $

```
$ echo "Hello, XiangShan"
$ echo "Have a nice day"
```

- **Description and notes** are presented in **grey box** with prefix #

```
# Please prepare a laptop with an SSH client.
# Next, let's start the demo session !
```

Let's Start!

Prerequisites

- **Login to the provided cloud server**
  - **Windows (Windows Terminal / PowerShell is recommended)**

```
PS > ssh guest@8.208.78.58
# Password: openxiangshan
```

  - **Linux / Mac**

```
$ ssh guest@8.208.78.58
# Password: openxiangshan
```

For **offline users**, please refer to https://github.com/OpenXiangShan/xs-env/tree/tutorial-new

Prerequisites

```
# Copy tutorial environment to your dir based on your name
$ cp -r /opt/xs-env ~/<YOUR_NAME>

# Enter your dir
$ cd ~/<YOUR_NAME>

# Set up environment variables
# DO IT AGAIN when opening a new terminal
$ source env.sh
# SET XS_PROJECT_ROOT:                    /home/guest/YOUR_NAME
# SET NOOP_HOME (XiangShan RTL Home):     $XS_PROJECT_ROOT/XiangShan
# SET NEMU_HOME:                          $XS_PROJECT_ROOT/NEMU
# SET AM_HOME:                            $XS_PROJECT_ROOT/nexus-am
```

Prerequisites

```
# Project Structure
$ tree -d -L 1
.
├── env-scripts        Useful scripts
├── NEMU               NEMU
├── XiangShan          XiangShan processor
├── nexus-am           Abstract machine
└── tutorial           Scripts and patches for tutorial

# Enter XiangShan directory
$ cd XiangShan
```

Chisel Compilation

- **Compile RTL and build simulator with Verilator**

```
$ make emu CONFIG=MinimalConfig MFC=1 -j8
```

Options:

CONFIG=MinimalConfig	*Configuration of XiangShan*
MFC=1	*Enable MLIR Firrtl Compiler*
// EMU_THREADS=2	*Simulation threads*
// EMU_TRACE=1	*Enable waveform dump*
// WITH_DRAMSIM=1	*Enable DRAMSim3 for DRAM simulation*
// WITH_CHISELDB = 1	*Enable ChiselDB feature*
// WITH_CONSTANTIN = 1	*Enable Constantin feature*

- **Compilation might take 10 mins~**

Open Another Terminal

```
# login to the cloud server again
$ ssh guest@8.208.78.58
# Password: openxiangshan

# Come back to XiangShan directory
$ cd ~/<YOUR_NAME> && source env.sh && cd XiangShan
```

Run RTL Simulation with Verilator

- **After building, we can run the simulator**

```
# run pre-built simulator
$ ../tutorial/emu -i ../tutorial/hello.bin --no-diff 2>hello.err

# Some key options:
    -i                          Workload to run
    -C / -I / -W                Max cycles  /Max Insts  / Warmup Insts
    --diff=PATH / --no-diff     Compare with NEMU for difftest / disable difftest
```

Great!

We have learned the basic simulation process of Xiangshan.

Once we get the RTL simulator ready, what's next?

How can we

- **generate desired workloads**
- **find and fix functional bugs**
- **do performance analysis**
- **do research on micro-architecture**

MinJie Functional Verification

LightSSS

Bare Metal Runtime: Nexus-AM

- **Purpose**
  - Generate workloads **agilely** without an OS
  - Provide runtime framework for **bare metal machines** like XiangShan
- **We present a bare metal runtime called Nexus-AM**
  - Light-weight, easy to use
  - Implement basic **system call** interfaces and exception handlers
  - Support multiple **ISAs and configurations**

Nexus-AM

- **Hands-on:** build Coremark workload
- **Showcase**

```
$ cd ~/<YOUR_NAME> && source env.sh && cd tutorial
$ bash build-am.sh
```

```
# cd $AM_HOME/apps/coremark
# make ARCH=riscv64-xs
# ls -l build
#     coremark-riscv64-xs.bin    Binary image of the program
#     coremark-riscv64-xs.elf    ELF of the program
#     coremark-riscv64-xs.txt    Disassembly of the program
```

ISA REF: NEMU

- **Purpose**
  - Golden model for verification
  - Simple yet high performance
- **We present NEMU**
  - An **instruction set simulator**, similar to Spike
  - Through **optimization techniques**, achieve performance similar to QEMU.
  - **A set of APIs** is provided to assist XiangShan in comparing and verifying the **architectural states**

NEMU

- **Showcase**

```
$ bash build-nemu.sh
```

```
# cd $NEMU_HOME
# make clean
# make riscv64-xs_defconfig
# make -j      build NEMU as the bare metal machine, can run the Coremark from the previous step
# make clean-softfloat
# make riscv64-xs-ref_defconfig
# make         build NEMU as the reference model for XiangShan
```

NEMU

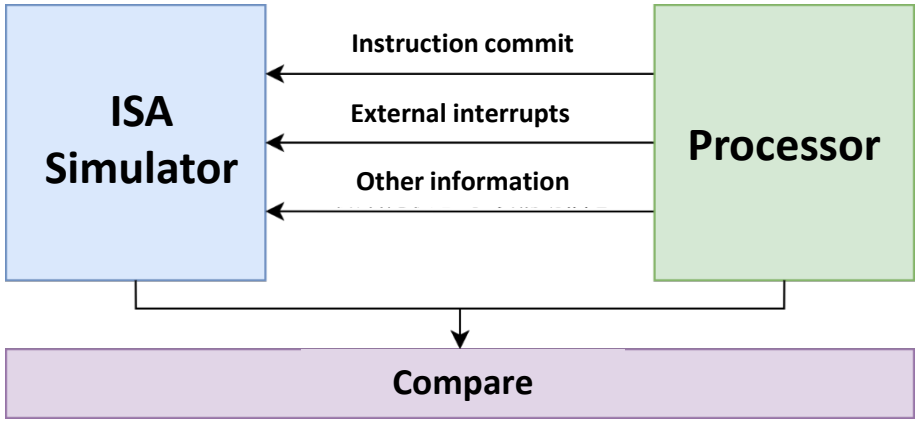
- **Hands-on:** run Coremark workload on NEMU
- **Showcase**

```
$ bash run-nemu.sh
```

```
# cd $NEMU_HOME
# ./build/riscv64-nemu-interpreter -b \                    run in batch mode, faster
$AM_HOME/apps/coremark/build/coremark-riscv64-xs.bin       set workspace to Coremark
```

ISA co-simulation using Difftest

- **Basic flows**
  - Instructions commit/other states update
  - The simulator executes the same instructions
  - Compare the architectural states between DUT and REF
  - Abort or continue
- **Provided as verification infrastructure for processors**
  - APIs for HDLs such as Chisel/Verilog
  - RTL simulators such as Verilator, VCS
  - RISC-V ISS such as **NEMU**, **Spike**
- **SMP-Difftest: co-simulation on an SMP processor**
  - SMP Linux kernel and multi-threading programs
  - Online checking of cache coherency and memory consistency



Basic architecture of DiffTest

```
while (1) {
  icnt = cpu_step();
  nemu_step(icnt);
  r1s = cpu _getregs();
  r2s = nemu_getregs();
  if (r1s != r2s) { abort(); }
}
```

Online checking

Difftest

- **Hands-on:** run Coremark workload on XiangShan, difftest with NEMU
- **Showcase**

```
# Running Coremark takes about 2 minutes
$ bash run-emu.sh
```

```
# ./emu \          if the simulator is successfully compiled, you can use $NOOP_HOME/build/emu
-i $AM_HOME/apps/coremark/build/coremark-riscv64-xs.bin \   use coremark.bin
--diff $NEMU_HOME/build/riscv64-nemu-interpreter-so \       difftest with NEMU
2>perf.out       redirect stderr to file
```

Difftest

```
./emu -i $AM_HOME/apps/coremark/build/coremark-riscv64-xs.bin --diff $NEMU_HOME/build/riscv64-nemu-interpreter-so
Emu compiled at Mar 24 2023, 20:33:03
Using simulated 32768B flash
[warning]no valid flash bin path, use preset flash instead
The image is /home/guest/xs-env-asplos2023/nexus-am/apps/coremark/build/coremark-riscv64-xs.bin

instrCnt = 398,372, cycleCnt = 517,099, IPC = 0.770398
Seed=0 Guest cycle spent: 517,103 (this will be different from cycleCnt if emu loads a snapshot)
Host time spent: 77,559ms
```

Difftest

- **Hands-on:**
  - We injected a bug in a pre-built XiangShan processor
  - Now, let's trigger it on the pre-built buggy XiangShan by Difftest
- **Showcase**

```
$ bash run-emu-diff.sh
```

```
# ./emu-bug \
  -i $AM_HOME/apps/coremark/build/coremark-riscv64-xs.bin \
  --diff $NEMU_HOME/build/riscv64-nemu-interpreter-so    # difftest with NEMU
```

Difftest

- Difftest will report the error once failed
  - Dump info like PC, GPRs, etc.
  - Point out the differences

```

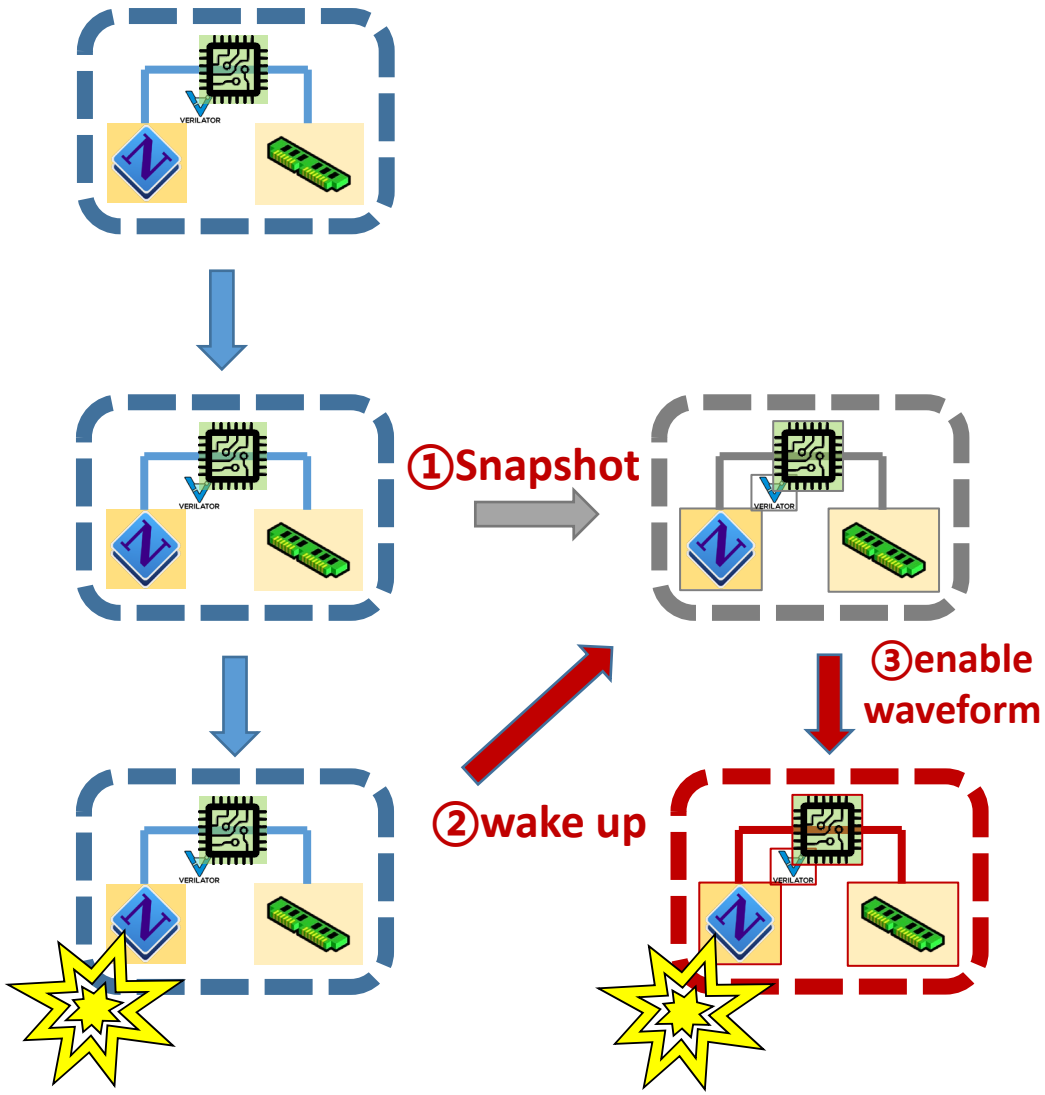
LightSSS

Light-weight Simulation SnapShot: LightSSS

- **Re-run simulation is time-consuming!**
  - **Snapshot is the way out**
- **LightSSS: snapshots of the process with fork()**
  - Copy-on-write on Linux Kernel
- **Advantage 1: Good portability and scalability**
  - Snapshots for any external models (such as C++)
  - No need to understand details of external models
- **Advantage 2: Low overhead of snapshots**
  - ~500us for taking a snapshot
  - Far less overhead than RTL snapshots by Verilator



LightSSS for on-demand debugging (waveform)

- **Hands-on:** use lightSSS to dump waveform
- **Showcase**

```
$ bash run-emu-lightsss.sh
```

```
# ./emu-bug \
-i $AM_HOME/apps/coremark/build/coremark-riscv64-xs.bin \
--diff $NEMU_HOME/build/riscv64-nemu-interpreter-so \
--enable-fork \
2 > lightsss.err
```

No longer need to use complex parameters

LightSSS for on-demand debugging (waveform)

- **Hands-on:** use lightSSS to dump waveform
- LightSSS is working if you see:

```
[FORK_INFO pid(NUMBER)] the oldest checkpoint start to dump wave and dump nemu log...
[FORK_INFO pid(NUMBER)] dump wave to /SOME/PATH/XXX.vcd...
```

- After that, simulation will start again from the existing latest snapshot

Debug-friendly Structured Database: ChiselDB

- **Motivation:**
  - Waveforms are **large** in size and **hard to apply** further analysis
  - Need to analyze structured data like memory transaction trace
- **We present ChiselDB**
- **Highlights:**
  - Inserting probes between module interfaces in hardware
  - DPI-C: Using C++ function in Chisel code to transfer data
  - Persist in database, SQL queries supported

ChiselDB

- **Design source code:** *XiangShan/utility/src/main/scala/utility/ChiselDB.scala*
- **Usage:** Create table

```
// API: def createTable[T <: Record](tableName: String, hw: T): Table[T]
import huancun.utils.ChiselDB

class MyBundle extends Bundle {
        val fieldA = UInt(10.W)
        val fieldB = UInt(20.W)
}
val table = ChiselDB.createTable("MyTableName", new MyBundle)
```

ChiselDB

- **Usage:** Register probes

```
/* APIs
def log(data: T, en: Bool, site: String = "", clock: Clock, reset: Reset)
def log(data: Valid[T], site: String, clock: Clock, reset: Reset): Unit
def log(data: DecoupledIO[T], site: String, clock: Clock, reset: Reset): Unit
*/
table.log(
  data = my_data /* hardware of type T */,
  en = my_cond,   site = "MyCallSite",
  clock = clock,   reset = reset
)
```

ChiselDB

- **Example:** *XiangShan/src/main/scala/xiangshan/cache/mmu/L2TLB.scala*

```
class L2TlbMissQueueDB(implicit p: Parameters) extends TlbBundle {
   val vpn = UInt(vpnLen.W)
}

val L2TlbMissQueueInDB, L2TlbMissQueueOutDB = Wire(new L2TlbMissQueueDB)
L2TlbMissQueueInDB.vpn := missQueue.io.in.bits.vpn
L2TlbMissQueueOutDB.vpn := missQueue.io.out.bits.vpn

val L2TlbMissQueueTable = ChiselDB.createTable(
        "L2TlbMissQueue_hart" + p(XSCoreParamsKey).HartId.toString, new L2TlbMissQueueDB)

L2TlbMissQueueTable.log(L2TlbMissQueueInDB, missQueue.io.in.fire, "L2TlbMissQueueIn", clock, reset)
L2TlbMissQueueTable.log(L2TlbMissQueueOutDB, missQueue.io.out.fire, "L2TlbMissQueueOut", clock, reset)
```

ChiselDB

- **Hands-on: Analysis of Cache Coherence Violation**
  - Add ChiselDB
  - Inject bug
  - Compile and run
  - Analyze ChiselDB

ChiselDB

- **Hands-on: Analysis of Cache Coherence Violation**

```
# Inject bug – We set all Release Data as a constant value
$ cd chiseldb && cat cc_err.patch
```

```

ChiselDB

- **Hands-on: Analysis of Cache Coherence Violation**

```
# Analyze
$ bash step2-analyze.sh
```

```
# 1. sqlite query for all transactions on Eaddr
# 2. use script to parse TLLog
# sqlite3 $NOOP_HOME/build/*.db \
  "select * from TLLOG where ADDRESS=0x80008fc0" | \
  sh $NOOP_HOME/scripts/utils/parseTLLog.sh
```

ChiselDB:

 # Result: [Time | To_From | Channel | Opcode | Permission | Address | Data(0)]

 # Data successfully transferred from L1D to L2

186297 L2_L1D_0 C ReleaseData Shrink TtoN 80008fc0 000000000000000a

 # But when L1D acquires addr again, data loaded from L2 is wrong

187022 L2_L1D_0 A AcquireBlock Grow NtoB 80008fc0

187029 L2_L1D_0 D GrantData Cap toT 80008fc0 0000000000abcdef

 # So there must be something wrong when L2 records Release Data

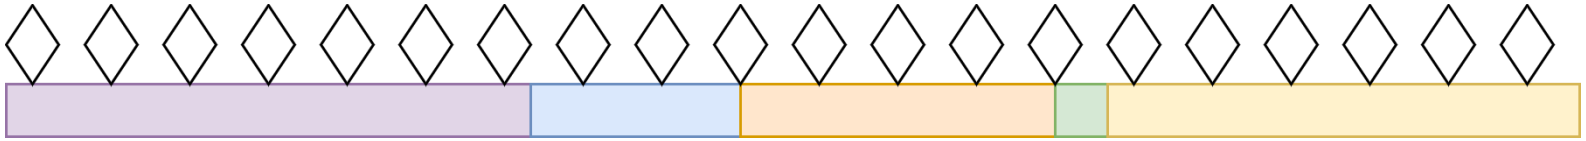
RISC-V Checkpoint

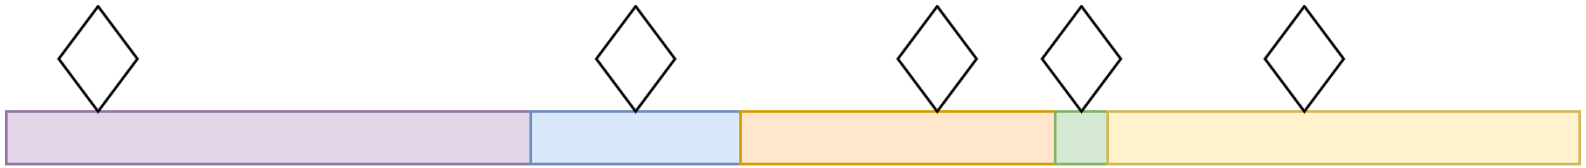
SimPoint

Checkpoints

- Uniform Checkpoint
- Divide a program to small parts which can be simulated in parallel



- Simpoint Checkpoint
- Select representative parts from a program with cluster analysis



Checkpoints: Uniform Checkpoint

- **step0: Prepare NEMU environment for checkpoints**

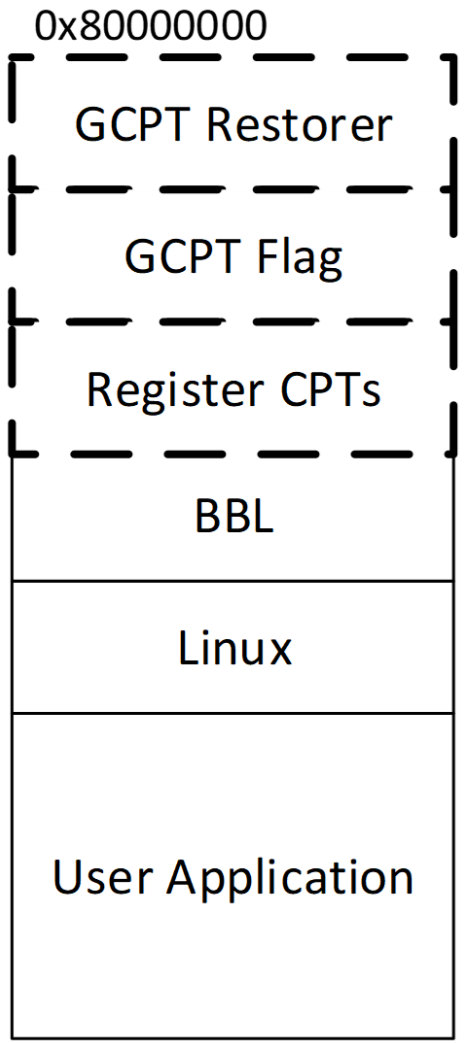
```
$ cd ../checkpoint          # tutorial/checkpoint
$ bash uniform-step0-prepare.sh
```

```
# uniform-step0-prepare.sh

# cd $NEMU_HOME

# git checkout asplos2023-tutorial
# git submodule update --init
# make clean
# make tutorial_defconfig
# make -j4

// generate gcpt restorer binary
# cd resource/gcpt_restore && make -j4
```



Basic format of RISC-V Checkpoint

Checkpoints: Uniform Checkpoint

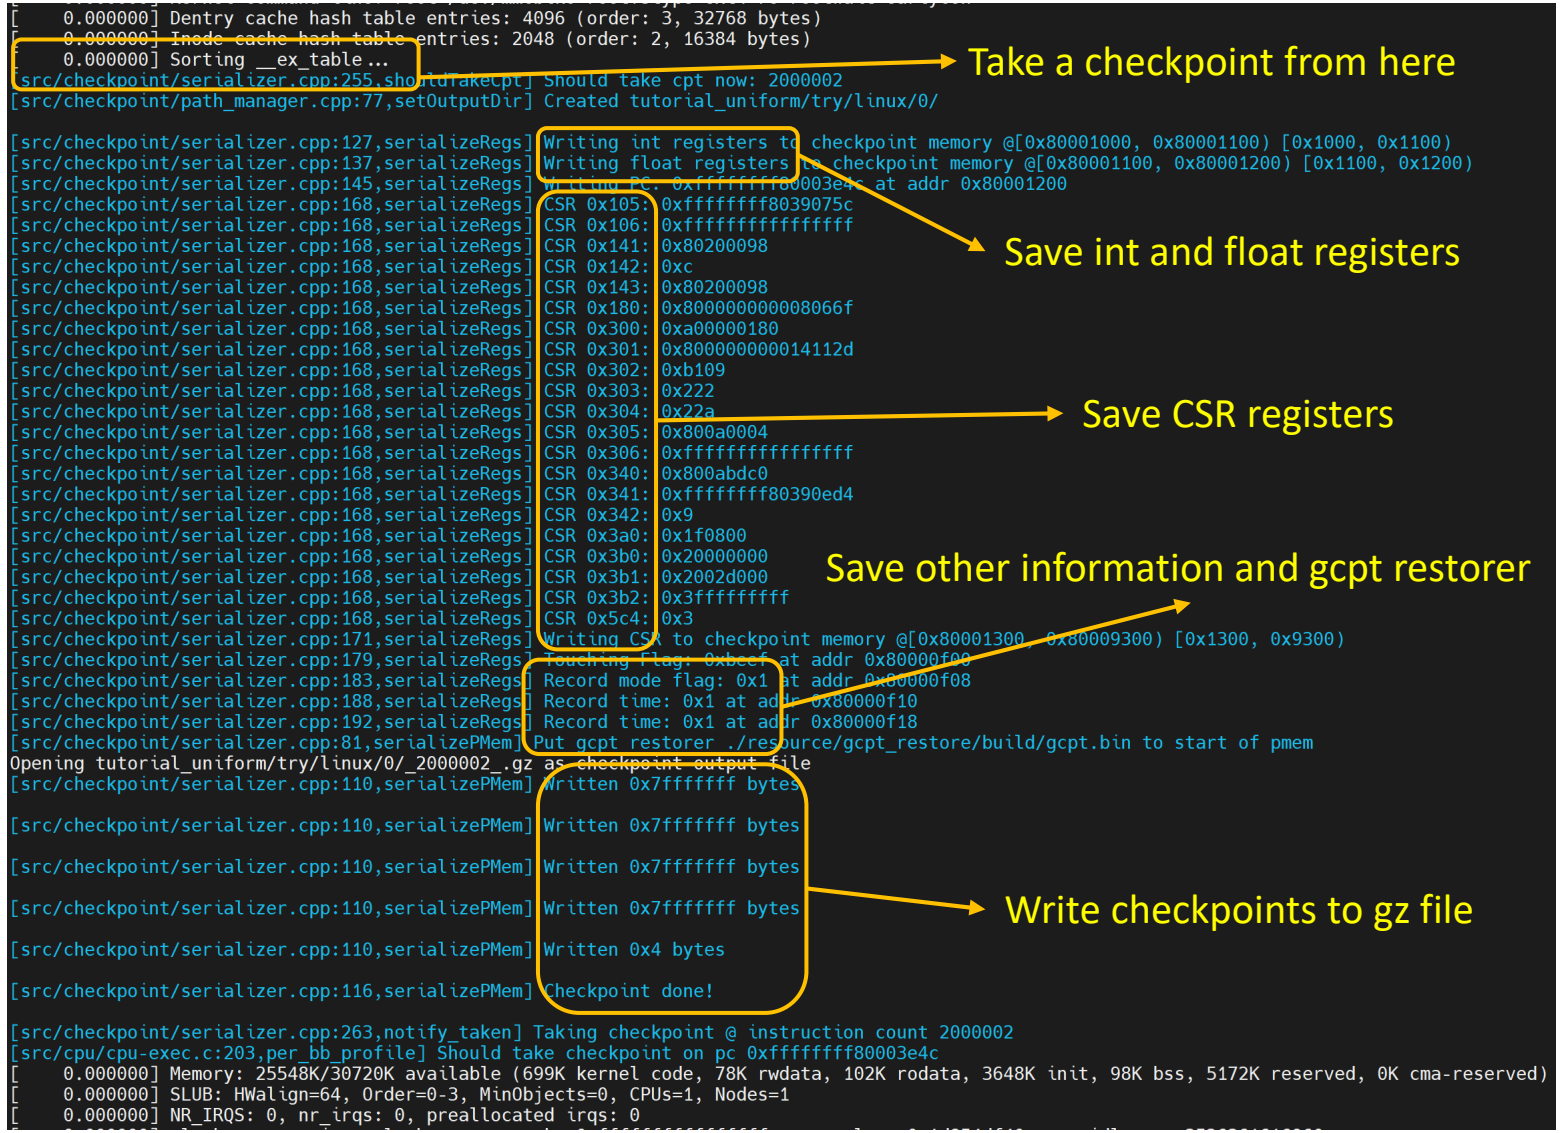
- **step1: Generate uniform checkpoints in NEMU**

```
$ bash uniform-step1-gen.sh
```

```
# uniform-step1-gen.sh

# cd $NEMU_HOME
# rm -rf tutorial_uniform
# ./build/riscv64-nemu-interpreter
#     --cpt-interval 2000000   the profiling period for simpoint
#     -u                       uniformly take cpt with fixed interval
#     -b                       run with batch mode
#     -D tutorial_uniform      directory where the checkpoint is generated
#     -C try                   name of this task
#     -w linux                 name of workload
#     -r ./resource/gcpt_restore/build/gcpt.bin  binary of gcpt restorer
#     --dont-skip-boot         checkpoint immediately after boot
#     -I 3000000               max number of instructions executed
#     ./ready-to-run/linux-0xa0000.bin
```

Checkpoints: Uniform Checkpoint



Checkpoints: Uniform Checkpoint

- **step2: Run the uniform checkpoint in NEMU or XiangShan**
- Here we take NEMU as an example

```
$ bash uniform-step2-run-nemu.sh
```

```
# uniform-step2-run-nemu.sh

# cd $NEMU_HOME

# ./build/riscv64-nemu-interpreter
#     -b                    run with batch mode
#     --restore             restoring from CPT FILE
#     -I 1000000            max number of instructions executed
#     `find tutorial_uniform/try/linux/0/ -type f -name "*.gz" | tail -1`
                            path of the checkpoint files just generated
```

Checkpoints: Uniform Checkpoint

Restore from checkpoint and load gz files

NEMU will start execution from the moment of that checkpoint

Checkpoints: Simpoint Checkpoint

- **step0: Prepare NEMU environment for Simpoint checkpoint**

```
$ bash simpoint-step0-prepare.sh
```

```
# simpoint-step0-prepare.sh

# cd $NEMU_HOME

# git checkout cpt-bk
# git submodule update --init
# cd resource/simpoint/simpoint_repo/analysiscode && make simpoint -j4
                                                    generate simpoint generator binary
# cd resource/gcpt_restore && make -j4   generate gcpt restorer binary

# cd $NEMU_HOME
# make clean
# make ISA=riscv64 XIANGSHAN=1 -j4       compile NEMU
```

Checkpoints: Simpoint Checkpoint

- **step1: Execute the workload and collect program behavior**

```
$ bash simpoint-step1-profiling.sh
```

```
# simpoint-step1-profiling.sh

# cd $NEMU_HOME
# rm -rf tutorial_simpoint

# ./build/riscv64-nemu-interpreter
#     -b                                  run with batch mode
#     -D $NEMU_HOME/tutorial_simpoint     directory where the checkpoint is generated
#     -C profiling                        name of this task
#     -w stream                           name of workload
#     --simpoint-profile                  is simpoint profiling
#     --interval 50000000                 simpoint interval instructions
#     $XS_PROJECT_ROOT/tutorial/bin/stream-0xa0000.bin
```

Checkpoints: Simpoint Checkpoint

```
[src/isa/riscv64/exec/special.c,38,exec_nemu_trap] Start profiling, resetting inst count

-------------------------------------------------------------
STREAM version $Revision: 5.10 $
-------------------------------------------------------------
This system uses 4 bytes per array element.
-------------------------------------------------------------
Array size = 2000000 (elements), Offset = 0 (elements)
Memory per array = 7.6 MiB (= 0.0 GiB).
Total memory required = 22.9 MiB (= 0.0 GiB).
Each kernel will be executed 10 times.
 The *best* time for each kernel (excluding the first iteration)
 will be used to compute the reported bandwidth.
-------------------------------------------------------------
Your clock granularity/precision appears to be 2047 microseconds.
Each test below will take on the order of 102400 microseconds.
   (= 50 clock ticks)
Increase the size of the arrays if this shows that
you are not getting at least 20 clock ticks per test.
-------------------------------------------------------------
WARNING -- The above is only a rough guideline.
For best results, please be sure you know the
precision of your system timer.
-------------------------------------------------------------
Function    Best Rate MB/s  Avg time     Min time     Max time
Copy:            710.2     0.023438     0.022528     0.024576

  For the BIC threshold, the best clustering was run 3 (k = 2)
  Post-processing run 3 (k = 2)
```

Compute the information of K-means clustering

Obtain multiple program representitive checkpoints

Checkpoints: Simpoint Checkpoint

- **step3: Generate corresponding Checkpoints based on clustering results**

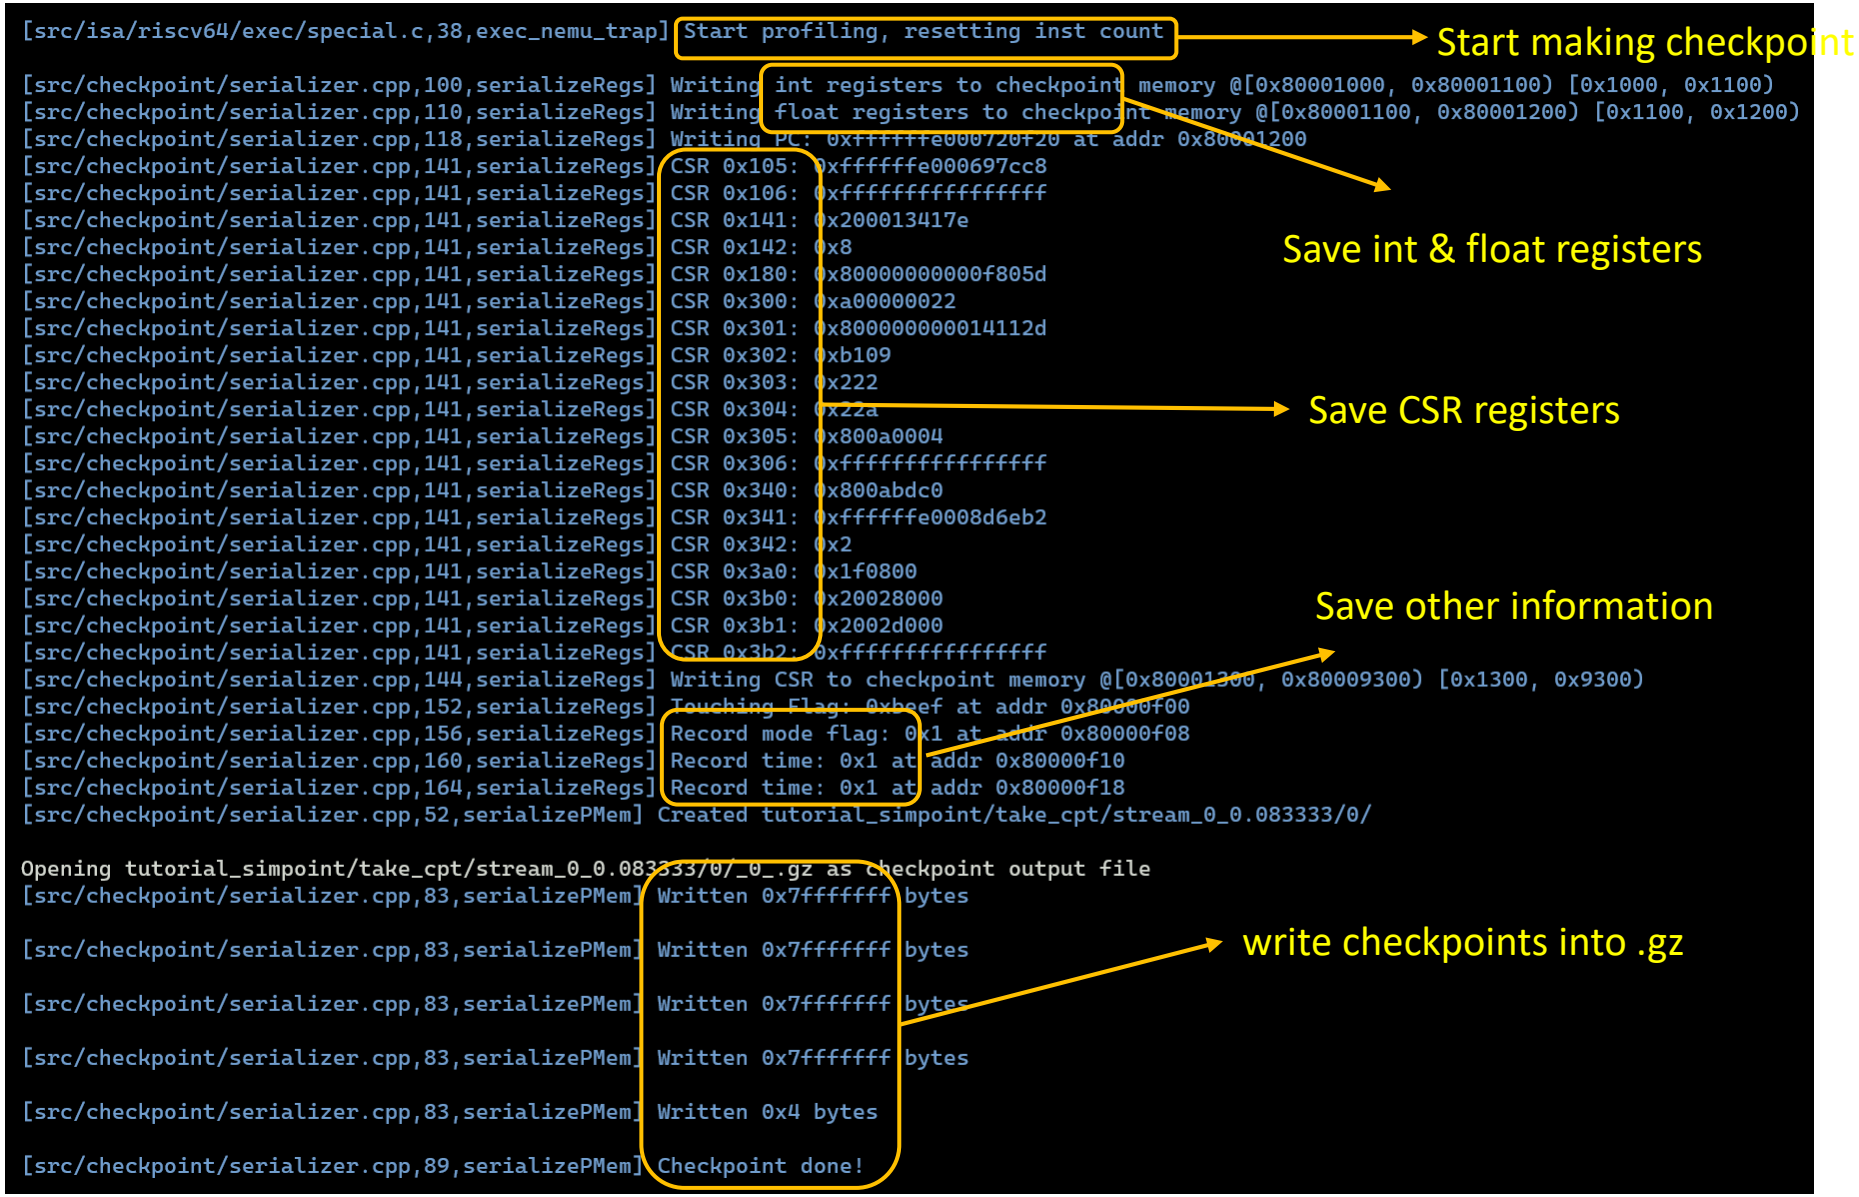
```
$ bash simpoint-step3-take-cpt.sh        # It may take about 3 minutes
```

```
# simpoint-step3-take-cpt.sh

# cd $NEMU_HOME
# rm -rf $NEMU_HOME/tutorial_simpoint/stream/take_cpt

# ./build/riscv64-nemu-interpreter
#     -b                                  run with batch mode
#     -D tutorial_simpoint                directory where the checkpoint is generated
#     -C take_cpt                         name of this task
#     -w stream                           name of workload
#     -S ./tutorial_simpoint/cluster      simpoints dir
#     --checkpoint-interval 50000000      simpoint interval instructions
#     $XS_PROJECT_ROOT/tutorial/bin/stream-0xa0000.bin
```

Checkpoint: Simpoint Checkpoint



Checkpoints: Simpoint Checkpoint

- **step4: Run the simpoint checkpoint in NEMU or XiangShan**
- Here we take XiangShan as an example

```
$ bash simpoint-step4-run-xs.sh
```

```
# simpoint-step4-run-xs.sh

$XS_PROJECT_ROOT/tutorial/emu
    -i `find $NEMU_HOME/tutorial_simpoint/ -type f -name "*.gz" | tail -1`
    --diff $NOOP_HOME/ready-to-run/riscv64-nemu-interpreter-so
    --max-cycles=100000
    2>simpoint.err
```

Simulation Performance Counter

- **Two common types:**
  - **Accumulation**： basic accumulator counter
  - **Histogram**： count the distribution

Accumulation:

[PERF][time=10000] ctrlBlock.rob: commitInstr, 1500

[PERF][time=10000] ctrlBlock.rob: waitLoadCycle, 800

Histogram:

[PERF][time=10000] l2cache: acquire_period_10_20, 15

[PERF][time=10000] l2cache: acquire_period_20_30, 200

[PERF][time=10000] l2cache: acquire_period_30_40, 60

Simulation Performance Counter

- **Usage:**
  - Add *XSPerfAccumulate('name', signal)* or *Histogram* wherever you want
  - **By default**, it is printed after simulation finishes
  - Set *DebugOptions(EnablePerfDebug = false)* to turn off
- **Showcase**

```
$ cd ..
$ bash run-emu-perf.sh
```

```
# ./emu -i hello.bin \
  --diff $NEMU_HOME/build/riscv64-nemu-interpreter-so 2>perf.err
```

```
$ less perf.err
```

Simulation Performance Counter

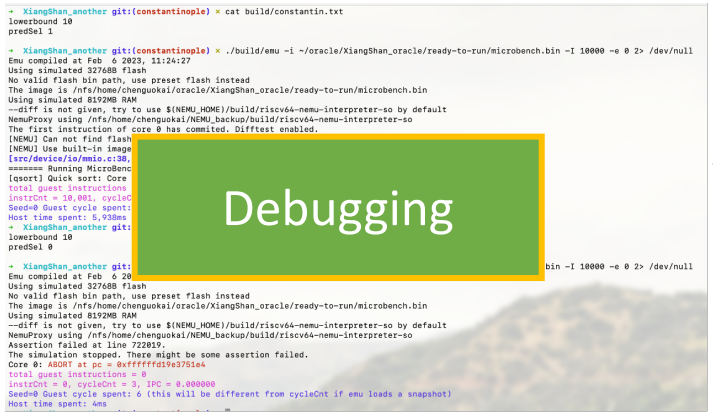
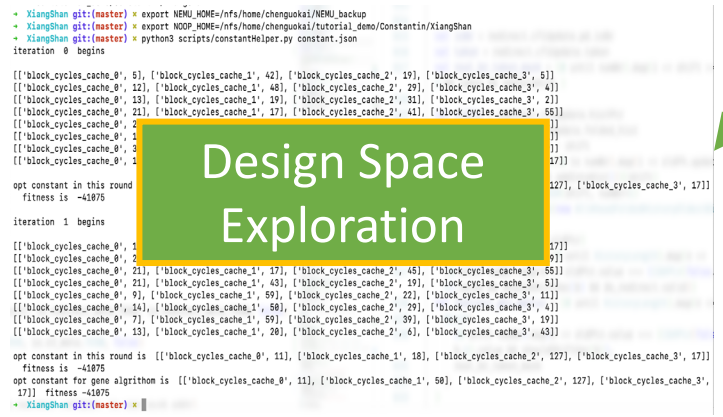
ConstantIn

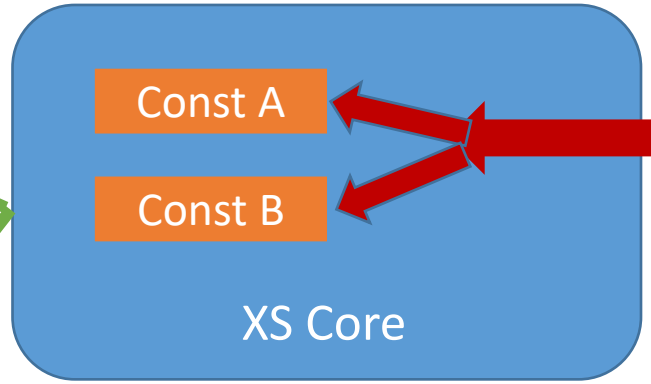
- **Motivation**
  - Wanna test the performance under different parameters
  - But re-compilation is **time consuming**
  - Can we change parameters(constants) at runtime?
- **We present Constantin** (Constant - in)
- **Design/Highlights:**
  - DPI-C： Using C++ function in Chisel code (through Verilog using BlackBox)
  - Signal values configured at runtime rather than compile time

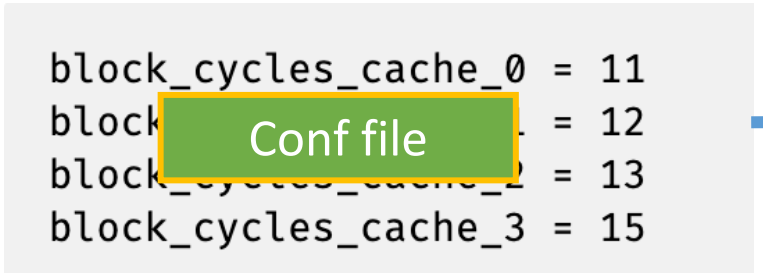
Constantin

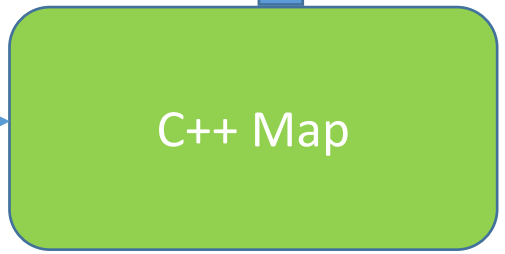
- **Constants keep constant only during runtime**











Constantin

- **Usage:** Create signal
- XiangShan/coupledL2/src/main/scala/coupledL2/prefetch/TemporalPrefetch.scala

```
139   require(cacheParams.hartIds.size == 1)
140   val hartid = cacheParams.hartIds.head
141   // 0 / 1: whether to enable temporal prefetcher
142   private val enableTP = WireInit(Constantin.createRecord("enableTP"+hartid.toString, initValue = 1.U))
143   // 0 ~ N: throttle cycles for each prefetch request
144   private val tpThrottleCycles = WireInit(Constantin.createRecord("tp_throttleCycles"+hartid.toString, initValue = 4.U(3.W)))
145   // 0 / 1: whether request to set as trigger on meta hit
146   private val hitAsTrigger = WireInit(Constantin.createRecord("tp_hitAsTrigger"+hartid.toString, initValue = 1.U))
147   // 1 ~ triggerQueueDepth: enqueue threshold for triggerQueue
148   private val triggerThres = WireInit(Constantin.createRecord("tp_triggerThres"+hartid.toString, initValue = 1.U(3.W)))
149   // 1 ~ tpEntryMaxLen: record threshold for recorder and sender (storage size will not be affected)
150   private val recordThres = WireInit(Constantin.createRecord("tp_recordThres"+hartid.toString, initValue = tpEntryMaxLen.U))
151   // 0 / 1: whether to train on vaddr
152   private val trainOnVaddr = WireInit(Constantin.createRecord("tp_trainOnVaddr"+hartid.toString, initValue = 0.U))
153   // 0 / 1: whether to eliminate L1 prefetch request training
154   private val trainOnL1PF = WireInit(Constantin.createRecord("tp_trainOnL1PF"+hartid.toString, initValue = 0.U))
```

Constantin

- **Hands-on:** Pass constant via standard input stream

```
$ cd constantin                    # now in tutorial/constantin
```

```
# Build emu with constantin (time consuming, use pre-built emu instead)
# bash step0-build.sh
```

```
# Run emu and pass constant
$ bash step1-basic.sh
```

```
please input total constant number
```

```
2
```

```
please input each constant ([constant name] [value])
```

```
tp_recordThres0 14
tp_throttleCycles0 3
```

Constantin

- **Hands-on:** Pass constant via standard input stream

```
~/tu/test/t/constantin tutorial-new = ?4 > bash ./step1-basic.sh

Constantin

- **Feature:** Auto Solving of better constant values
- **Process**
  - Enable AutoSolving & prepare signals
  - Compile
  - Run basic demonstration
  - Set parameters for AutoSolving
  - Auto solve
  - Cleanup

Constantin

- **Feature:** Auto Solving of better constant values

```
# Automatical parameter solver configuration file
$ cat constantin.json
```

- **Parameters defined**
  - properties of signals
  - target of Auto Solving
  - parameters of genetic algorithm
  - parameters of XS simulator

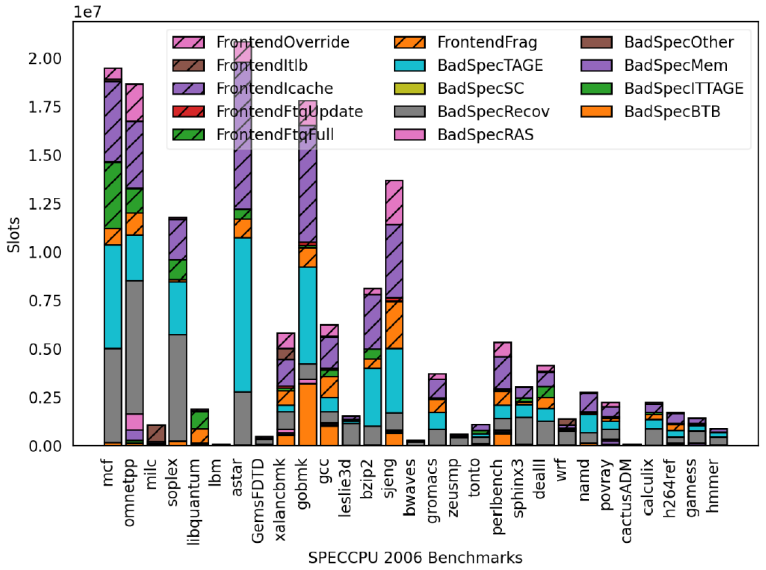
Constantin

- **Usage: Auto Solving of better constant values**

```
# Run auto solver, output will be the optimal constant currently found
$ bash step2-solve.sh

# The solver generates optimal parameters
opt constant for gene algrithom is
[['block_cycles_cache_0', XXX], ['block_cycles_cache_1', XXX],
 ['block_cycles_cache_2', XXX],  ['block_cycles_cache_3', XXX]]  fitness 0
```

Top-Down: Method for Performance Ana



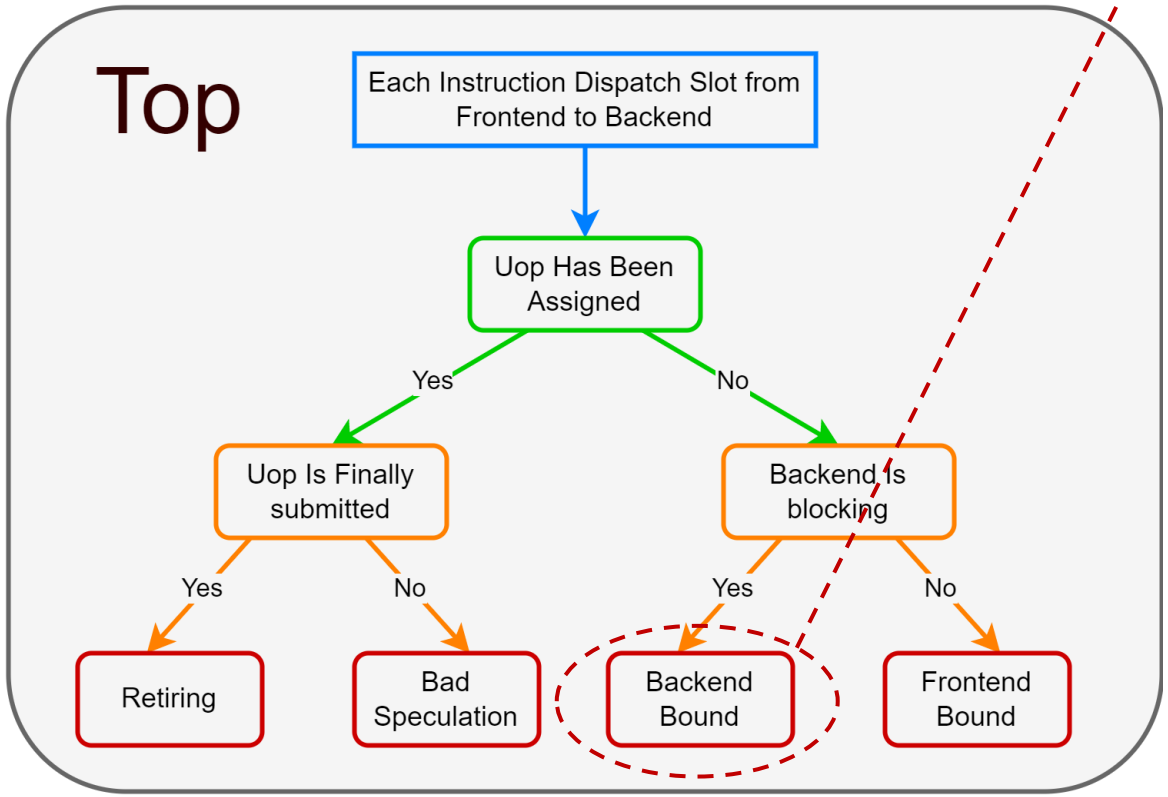
- Organize scattered performance events in a **hierarchical mar**
- **Accurately** calculate one event's impact on processor perfor

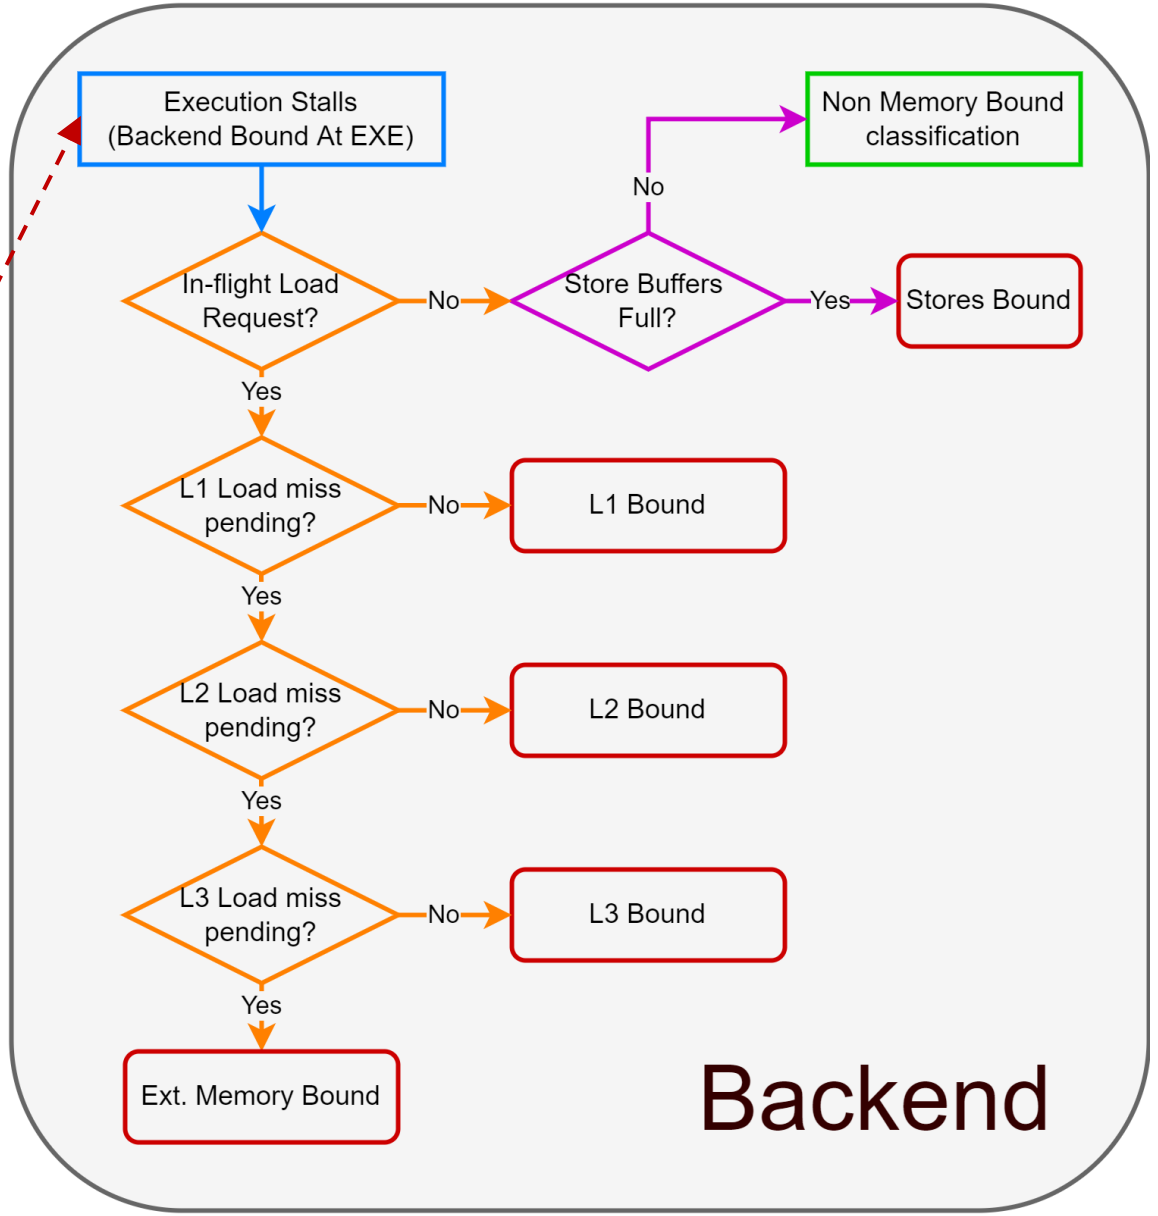
- We apply the Top-Down approach to XiangShan
  - Complete **targeted optimization adaptation** for RISC-V instruction set
  - Optimize **performance counters** according to XiangShan microarchitecture
  - Further refine the **hierarchical design** of Top-Down model
  - Without missing or duplicating any events
  - Without assuming the blocking cycles of performance events in advance

- Due to the limited time, we will not arrange a hands-on section here
  - Please refer to https://github.com/OpenXiangShan/XiangShan/tree/master/scripts/top-down

Top-Down

- Use Top and Backend as examples





Top-Down

- Setting Performance Counters in RTL Code

Dispatch.scala

```
val stallReason = Wire(chiselTypeOf(io.stallReason.reason))
// ...
TopDownCounters.values.foreach(ctr =>
  XSPerfAccumulate(ctr.toString(), PopCount(stallReason.map(_ === ctr.id.U)))
)
```

- Do simulation and collect performance counter data

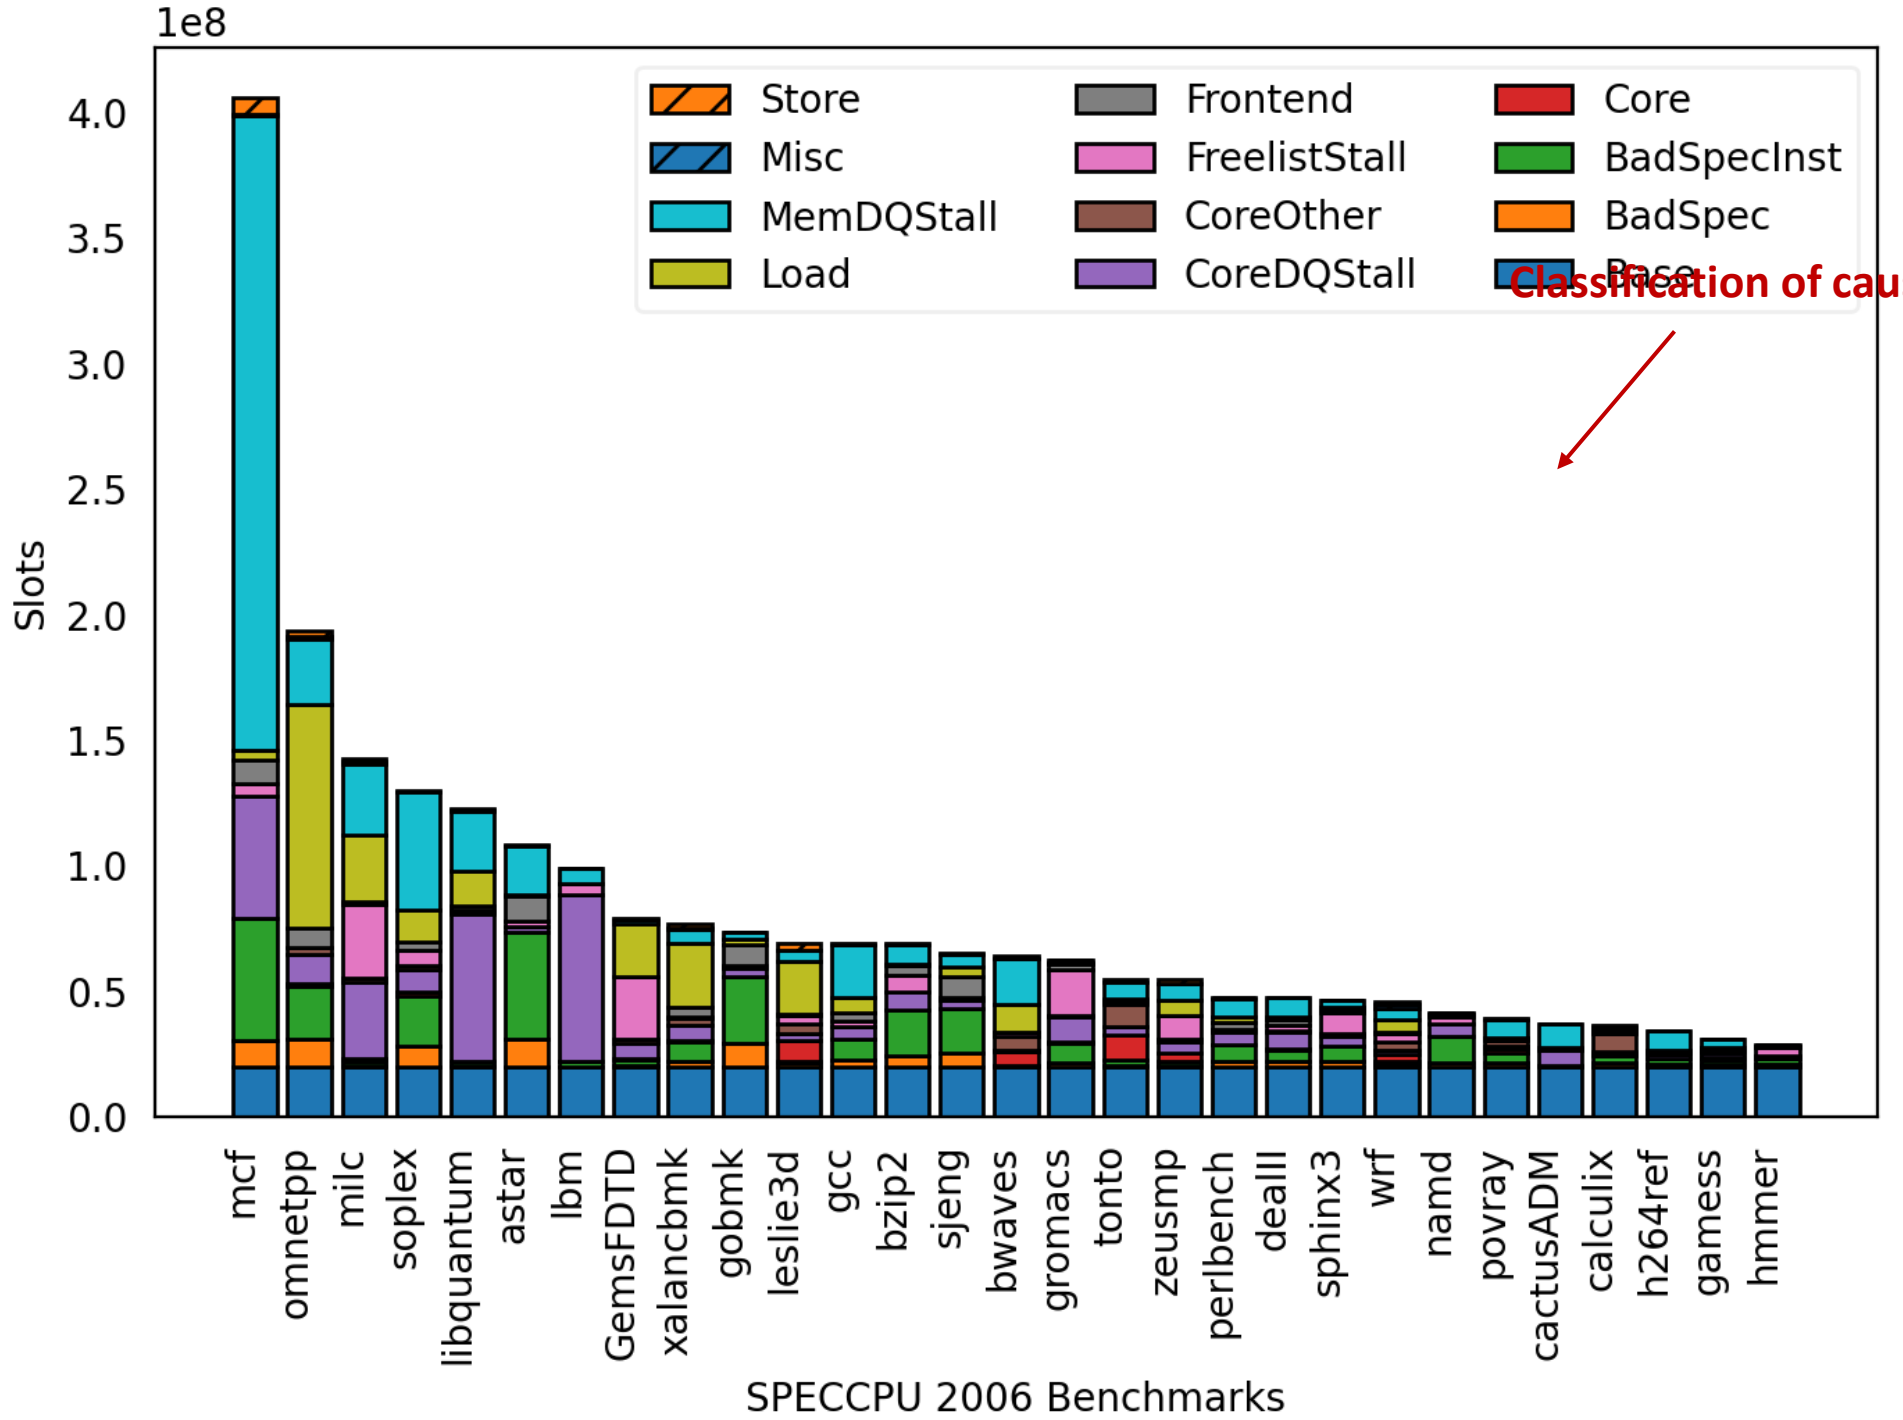
Top-Down

- Analyze through Top-Down method

```
env-scripts: perf/top_down/configs.py

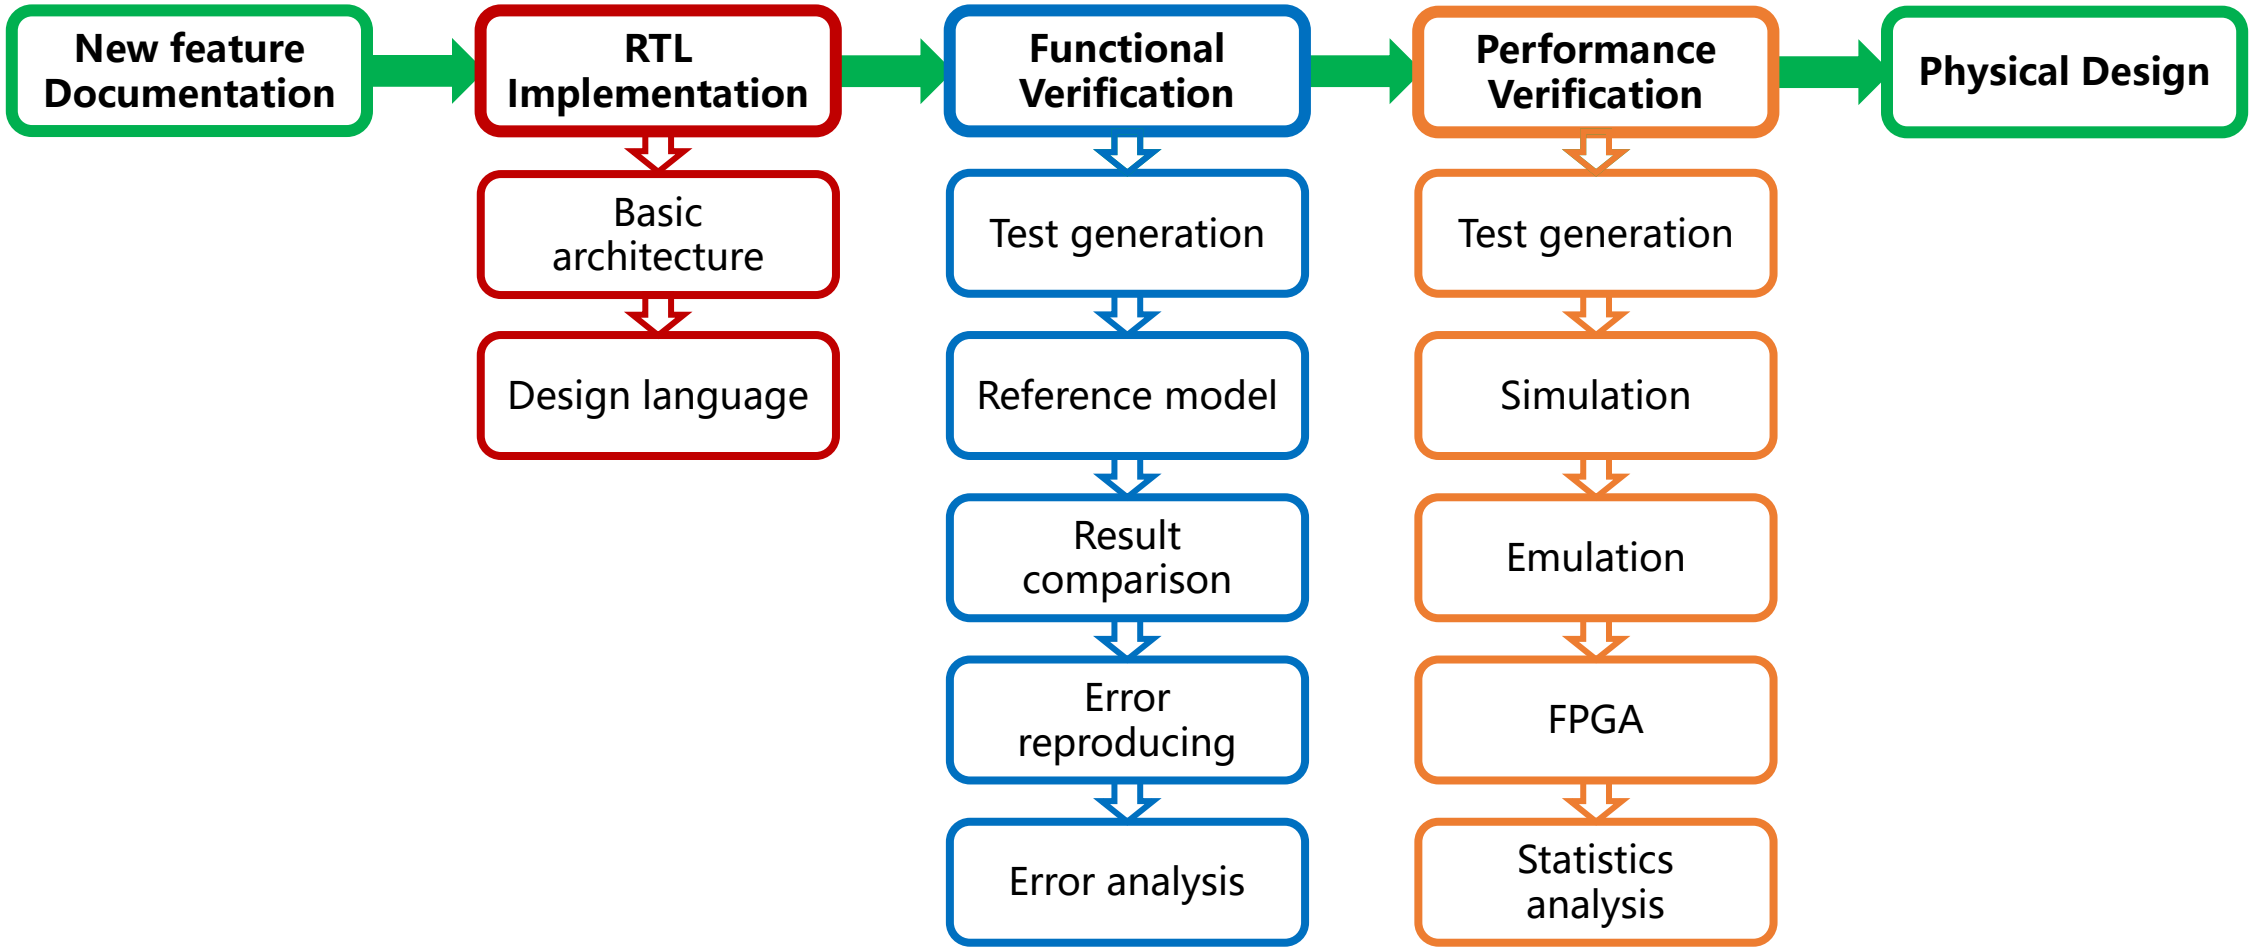
xs_coarse_rename_map = {
  'OverrideBubble': 'MergeFrontend',
  'FtqFullStall': 'MergeFrontend',
  ‘IntDqStall': 'MergeCoreDQStall',  # attribute perf-counters to Top-Down hierarchy
  'FpDqStall': 'MergeCoreDQStall'
}
```

- Obtain analysis results and make targeted optimizations



Classification of causes of congestion

Summary: MinJie Development Flows and Tools



Thanks!
